Project Portfolio

– A tool for Strategic Management

Thinking Portfolio® is a practical tool for strategic management. The portfolio management model supports business-driven planning and decision-making based on a firm overall grasp.

The starting points for the development of the concept have been project work and international frameworks for portfolio management such as PRINCE2, PMBOK and SAFe.

An organization implementing Thinking Portfolio is well-equipped for fast decision-making, agile change management, enhanced business drivenness, and risk management.

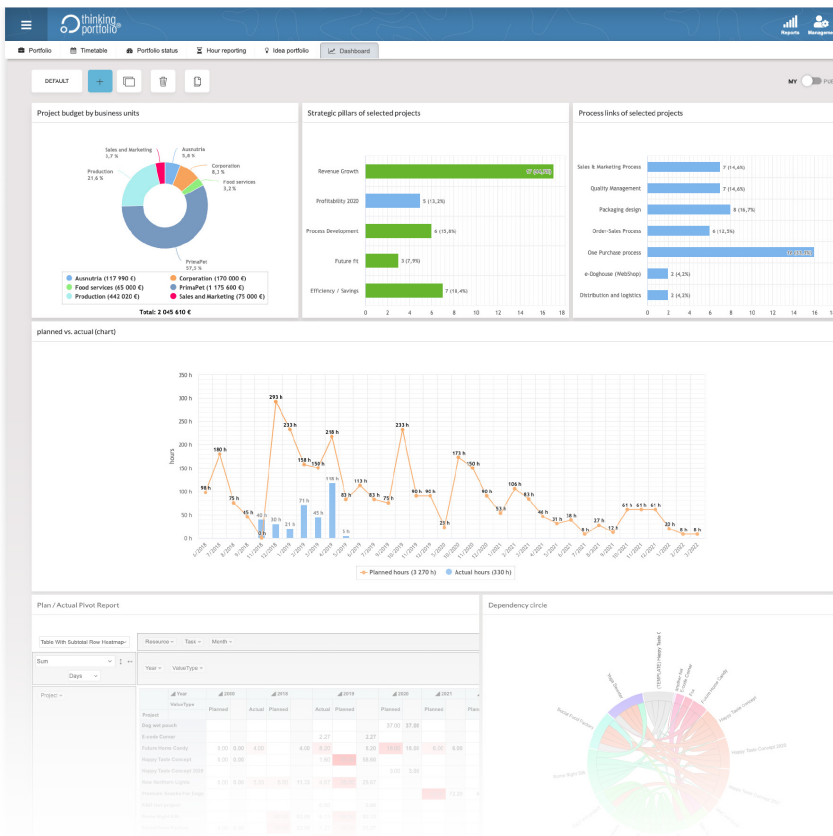

Thinking Portfolio's straightforward visual presentation method and browser-based user interface speed up its adoption. The use of the system requires no special training or manuals.

Thinking Portfolio has been developed by utilizing the latest Web technology.

The browser interface work with the latest versions of Edge, Firefox, Chrome, Safari, and with leading tablets.

The technical solution facilitates the implementation of various portfolio management applications. The portfolio application presented here is a strategic level management tool for development projects.

Benefits of Thinking Portfolio

Well-equipped for fast decision-making

Agile change management

Risk management

Strategic Portfolio Management

– Ideas, projects and assets

Using portfolios as a management tool is growing in popularity. Its purpose is to bring consistency, efficiency and transparency to management and decision-making.

Why Portfolio Management?

Transparency to management

Boost the efficiency of advance planning

A tool for risk management

The management of wide-ranging and multifaceted organizations is often complicated by the discrepancies between customer demands and expectations, problems with the flow of information, and a shortage of skilled professionals. This results in projects, overlapping and competing for the same resources, whose timing or content has not been optimized in any way; the link between practical execution and the core business strategy is often unclear.

Portfolio management is an operations model that attempts to alleviate the problems associated with fast-paced and multidimensional management. It creates operational prerequisites that at their best boost the efficiency of advance planning, decision-making, and implementation (Figure 1). Portfolio management consists of knowledge, processes and roles.

Portfolios are a specified way to pinpoint the resources and projects that will enable an organization to implement its strategy. There are three main types of management portfolios (Figure 2):

1. **The Development Portfolio** contains descriptions of the development proposals, ideas, and scenarios (for example development programs) aiming at the organization's future.
2. **The Project Portfolio** contains projects and their sub-projects that are planned, underway, or completed.
3. **The Asset or Resource Portfolio** contains, for example, applications, skills or processes that the organization has obtained for its use through development projects and investments.

The portfolios are interconnected; project proposals from the Development Portfolio are imported to the

Project Portfolio. The Project Portfolio generates an asset. Diminished property assets or poor performance generate development needs, and so forth.

The management principle

At its simplest, portfolio management is a question of managing and balancing earnings, investments, and risks. Earnings can be, for example, cost savings, a growth in productivity, the acquisition of new custom, or increased net sales. Investments also include the use of time and money; these include project work, training, start-up and maintenance.

There are many project risks, but also risks related to existing property, for example, the scalability of an ICT application or system in the growth or contraction of business operations.

Portfolios' connection to strategy and architecture

The portfolios are intermeshed through the organization's strategic criteria and classifications. Senior management defines the strategy's success factors and key results that are then described in the portfolios as separate criteria that are used to evaluate an idea, project, or application strategically.

Within the portfolios, identifying the equivalency between a project or property and its business, information, application and technology architecture is essential. For example, a certain new custom information system could adequately support an organization's strategy, but it might be incompatible with current application and technology architecture.

Figure 1. Project portfolio management

Success factors

The adoption of portfolio management can be a project, but its integration as part of an organization's daily operations requires a focused commitment and examples set by management. Portfolio management must become a part of the organization's leadership, for example, as part of the executive group's work.

An organization's level of maturity has significance if portfolio management is to succeed. If there are substan-

tial deficiencies in leadership skills or project operations, portfolio management will remain without a basis. The portfolios will be worthless if an organization lacks the ability to function according to their requirements.

Portfolio management requires tools for its support. Here as well, the tools are not the solution, but they support changes in ways of thinking.

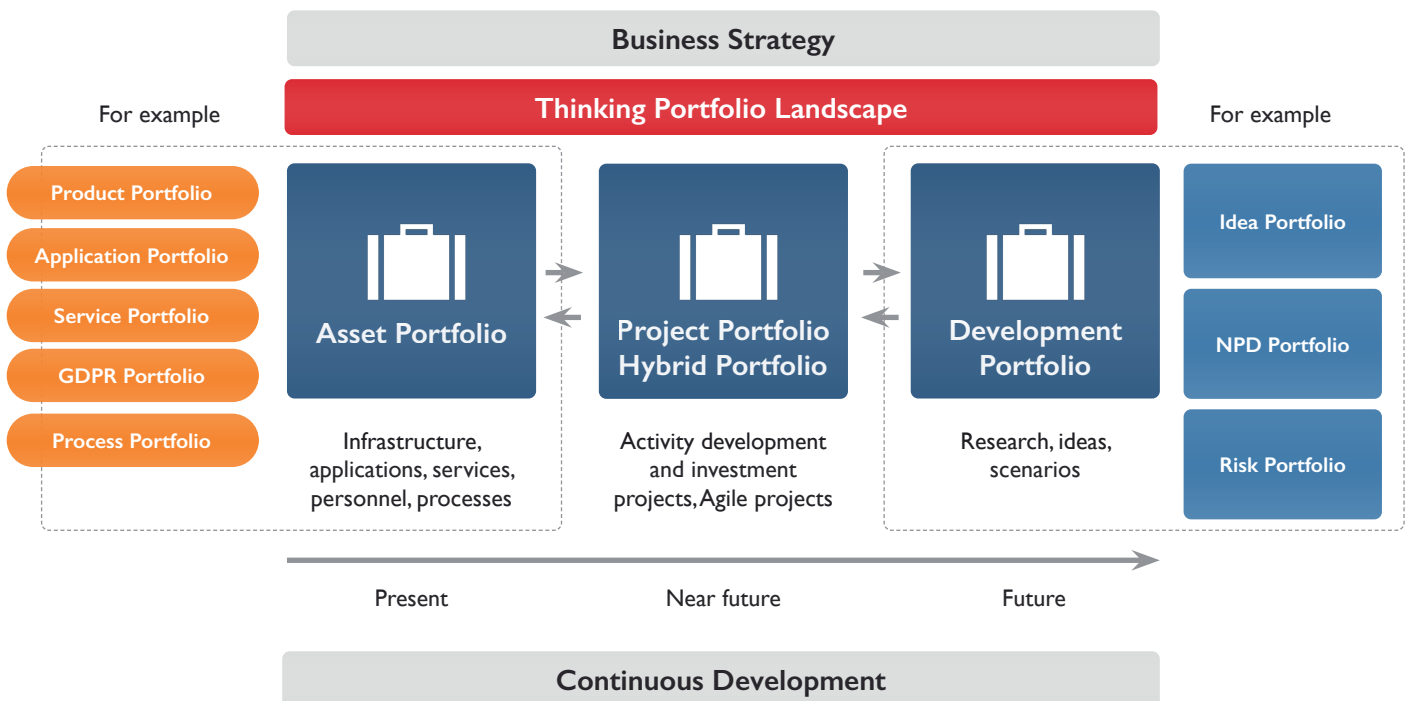

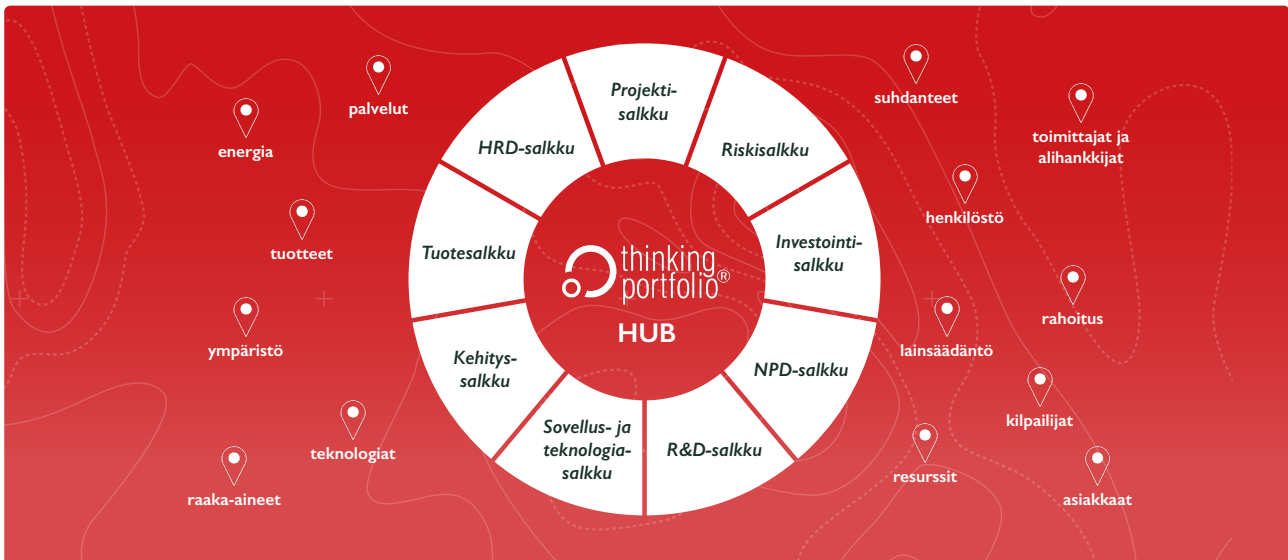

Figure 2. The strategic portfolios

Thinking Portfolio® Integrated Platform (HUB)

– centralised resource planning at the core

Benefits of Integrated Platform (HUB)

More versatile user management	Enhances the deployment of multiple portfolios	Administrator's user management of different portfolios
<ul style="list-style-type: none"> • Capability • Load • Resourcing 	<ul style="list-style-type: none"> • Overall resourcing for all portfolios • Creating relationships and dependencies between portfolios • Creating new experimental portfolios and developing further as the operations are maturing 	<ul style="list-style-type: none"> • For a user, an opportunity to supplement their knowledge

Landscape HUB

Thinking Portfolio's new HUB platform allows for even closer interconnection of the data models of multiple portfolios. At the core of Thinking Portfolio's Landscape HUB, implemented with the help of the HRD portfolio, there is centralised user management, which can be parameterised in a considerably more versatile manner than before. The deployment and use of new portfolios will be more efficient as well. Thinking Portfolio Landscape HUB offers the following benefits:

- Makes the user's competence transparent
- Centralised and simple user management for multiple different portfolios
- Centralised and easy visibility to resource management across different portfolios

- Support for the development discussion process
- Easier management of list values
- Overall resourcing for all portfolios (projects, absences, holidays)
- E.g., a centralised Kanban dashboard, where tasks are placed from different available portfolios

The transition to a new platform is free of charge to existing customers in connection with the deployment of a new portfolio. The terms and conditions will not change. The Landscape HUB entity contains then the following functionalities:

- User management of extended data model
- Other extensions to the HRD portfolio will be implemented as change work (e.g., capability maps, HRD Dashboard, HRD meters)

Renewed user management

The new user management is based on the HRD portfolio. Previously, accessing the portfolio user management required a separate administration interface. For example, user IDs were edited through it. In the new platform, user information is in its own portfolio, where the data is also managed.

New opportunities

When users are in their own portfolio, a more extensive portfolio model can be introduced. The data model can then be modified flexibly, as needed. For example, competence areas can be defined for users. The views can be fully parameterised, as needed. For example:

Competence management: searching for a user based on competence area

Detailed contact information

Resourcing in one portfolio – other portfolios use the resourcing portfolio data

Administrator's perspective

- User management is transferred from the current user management interface to its own portfolio

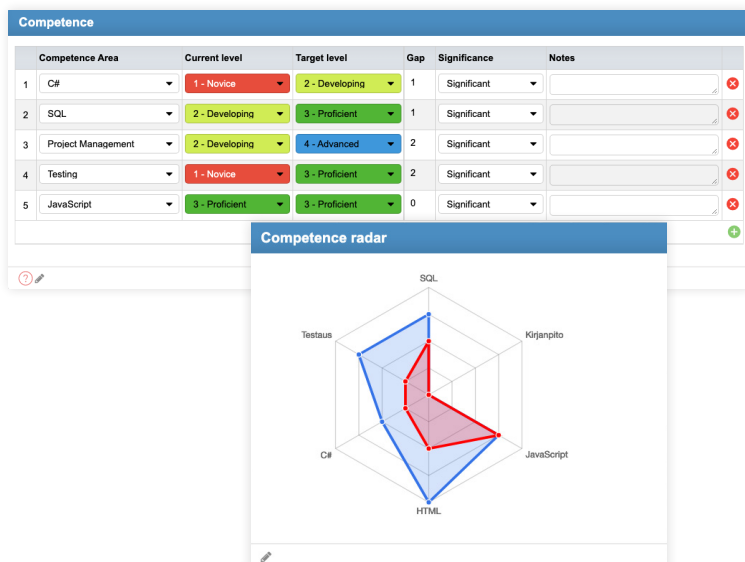

User's perspective

- Hour entries can also be made through one portfolio into other portfolios in the organisation
- Centralisation of Kanban task management in an HRD portfolio – the user can easily find all their tasks defined in different portfolios in one place.

Figures on this page. Renewed user management views: user list, basic user information, Kanban task management capabilities, certificates and competence map.

Main portfolio views: Project Directory and Schedule view

Directories

The Project Directory, an overview of the Project Portfolio (Figure above), shows the projects, for whose applications the user has viewing or editing rights. Color-coded fields indicate at a glance, for example, if a project's time schedule is late or its budget has been exceeded.

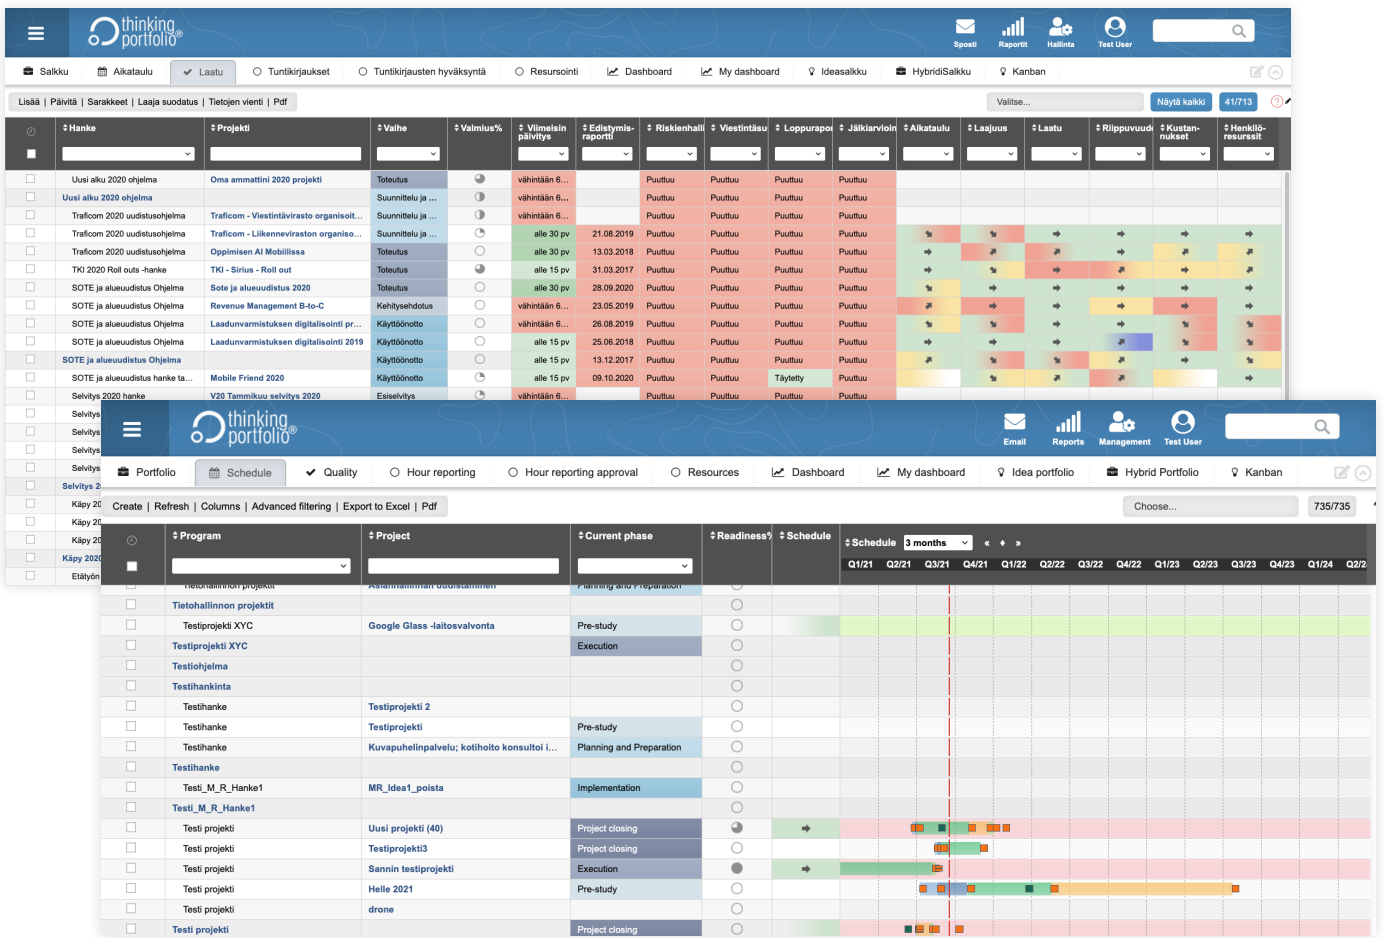

The header row helps in arranging or filtering according to selected criteria. Projects can be displayed, for example, by criticality or budget size with a single click. Users can also filter the results to display only the projects they are interested in viewing according to several simultaneous criteria.

The selections remain effective even if the user exits the application temporarily. The portfolio view can also be hierarchical, in which case, for example, projects and their sub-projects appear in the directory.

Quality

Thinking Portfolio's quality page uses color codes to indicate the status of projects' recorded information:

- Has the necessary information, such as the budget and time schedule, been specified for the project?
- Has a risk analysis been carried out?
- Which product information has not been updated within a month?

MyDashboard

New!

MyDashboard offers a personal view into the most important reports to follow (Figure 3). Separate report views can be created for different needs, and thus, for example, a project manager can create a ready view for the reports shown to the steering group and project team. With MyDashboard, the administrator can create reporting views visible to everyone.

The management of dashboards has become more versatile. The administrator can now publish a dashboard visible to everyone, and users can use it as basis to modify a version that best meets their needs, visible only to them.

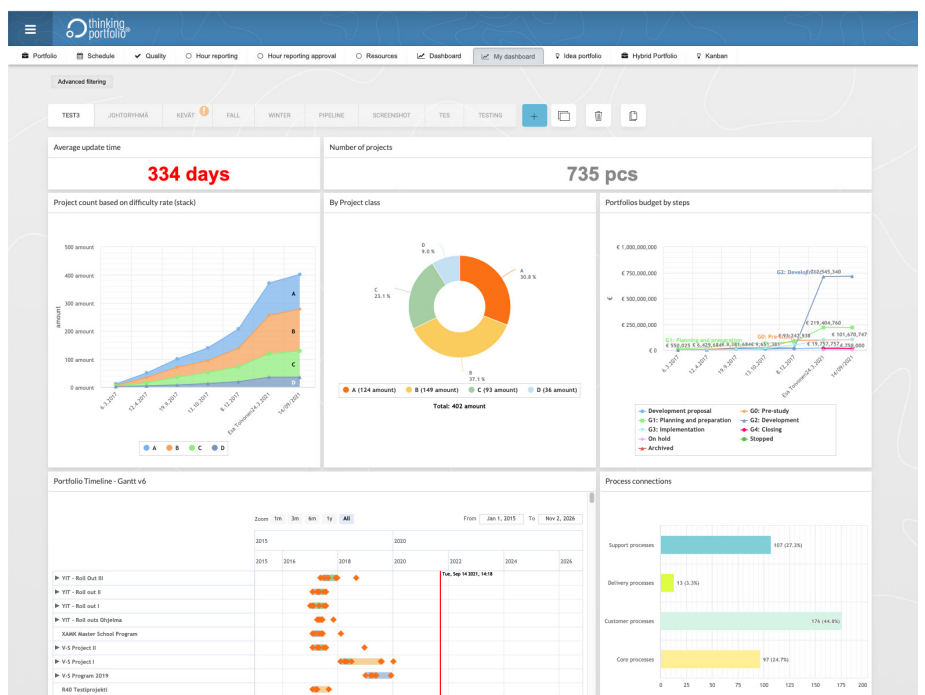

Figure 3. MyDashboard

Project Pages and Widgets

— *The Project-specific Information*

So-called widgets are Thinking Portfolio's building blocks. Currently, there are around 1000 different widgets in our library. Following are examples of some of the most frequently used widgets.

Project risks

The risks widget (Figure 4) facilitates a quick analysis of the risks associated with investments and development projects. Risks are assessed according to a project's implementation and its commercial viability.

Identifying the operational and technology risks makes it possible to define the project's risk level, determine the acceptable commercial risk level, and easily assess the effects of any interruptions or incomplete work on business operations.

Project resources

Thinking Portfolio visualizes the key resources required in different project stages, as well as their degree of workload in specified sub-projects (Figure 5). The objective is to optimize the utilization of valuable resources and coordinate the right human resource skills with the right stage.

Balancing the portfolio between the resources required by future and active ongoing projects is one of the most important objectives of sound portfolio management. Thinking Portfolio illustrates the optimal staging of plans and projects in relation to currently available resources.

The required development investments are specified according to the project's scope, staff needs, and direction.

Log / Diary

The Log Widget is a simple way to record a project's history information, such as the decisions made in meetings regarding changes in the project objectives' tracking data, in a memo-like format (Figure 6).

The Project Log can contain links, for example to intranet pages or project documents.

The Project Log is printed out as a Project Charter document, like the information from all other widgets.

Budget

The Budgeting Widget presents the project's costs (Figure 7). The approved budget is entered at the start of the project. It can contain internal work as well as procurements/investments.

The project manager updates the actuals, for example, monthly. The project manager assesses the budget's implementation with "traffic lights" from the reporting dates to the project's completion.

Financial calculations

Financial widgets depict profitability calculations such as:

- Cash flow calculation
- Discount rate
- Internal interest rate
- Payback period
- Financing plan

The cash flow calculation is a table-like presentation of a project's earnings and expenses from its early and operational periods (Figures 8 and 9). The presented figures are current values.

The cash flow calculation presents the cash flow during the first five years after a project's start-up. If the calculation period is longer, the figures for the final years are presented as a summary in the last column.

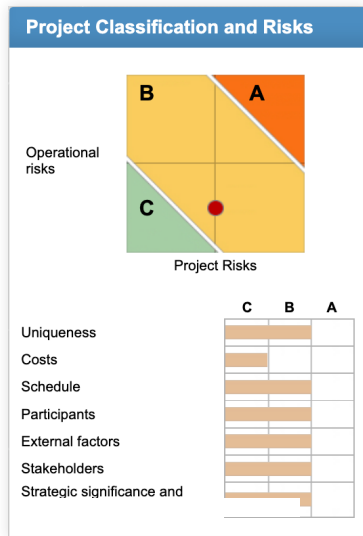

Figure 4. The risks widget

« » Latest estimate (baseline) (€)	2020	2021	2022	2023	2024	Total
Investment costs	4,000					62,500
Operating cost	4,000					17,000
Savings	25,000					59,000
Profit						
Total/Year	17,000					-20,500

Figure 9. Projects's business case cash flow calculation

Financing plan

The plan or project's financing situation and brief description of its financing plan can be presented in its own widget.

Calculations and other appendices

Thinking Portfolio presents financial calculations as summaries. More detailed itemizations and explanations are generally recorded in separate documents, for example, as Excel charts. The links to the appendices in question are entered in the document field.

Commercial effects

Thinking Portfolio's Business View Widgets are organized according to commercial allocations and investments (Figures 10-13). The portfolio's views are organized and visualized regarding, for example:

- Scope of utilization
- Degree of development
- Anticipated benefits and implementation methods
- Effects on development areas

Figure 10. Benefits map

Scope of utilization

When specifying the scope of utilization, the starting points are the company's operations and their interconnected processes. The operations and processes are determined according to the needs of the customer's organization at the portfolio management implementation stage.

Degree of development

Determining the degree of development will depend on whether the project is related to organizational innovation, expansion, or replacement. Developmental opportunities often relate to the facilitation of new business opportunities, or the growth or strengthening of current operations.

The 'Strategic goal' widget has a blue header. Below it is a 'Strategic goal' label and a 'Select all' button. A list of three goals is shown, each with a dropdown arrow and a red 'x' icon: 'Customer Experience', 'Efficiency', and 'Service digitalization'. Below the list is a 'Description of strategic goals' text area.

Figure 11. Strategic Goals

The 'Processes' widget has a blue header. Below it is a 'Processes' label and a 'Select all' button. A list of three process categories is shown, each with a dropdown arrow and a red 'x' icon: 'Customer processes', 'Support processes', and 'Core processes'. Below the list is an empty dropdown menu.

Figure 12. Connection to processes

The 'Strategic objectives' table has a blue header. It contains a legend: '3=significant support for objective realisation', '2=fair support related to objective realisation', and '1=minor influence related to objective realisation'. The table lists objectives under three categories: 'Priority objective for strategic portfolios', 'Other objectives for strategic portfolios', and 'Other strategic goals'. Each row includes a dropdown menu and a row of support level indicators (1, 2, 3, 4) with expand/collapse icons.

	1	2	3	4	
Priority objective for strategic portfolios					
1.1 Developing a service network for education and training					+
Other objectives for strategic portfolios					
2 Resource Wisdom in a Nature Town					+
4.2.2 Improved performance through good management, new ways of working and the tools that support them					+
2.1.1 The growth of municipal competitiveness and employment will be accelerated by reforming regional business and innovation services					+
Other strategic goals					
Child and youth welfare plan					+
Service level agreement					+
Owner Guidance Policies 2020					+

Figure 16. Strategic Objectives

Business architecture compatibility

The proposed plan or project can modify or support changes in the business architecture (Figure 14). An assessment of the business architecture expresses a position on the following levels:

- Enterprise architecture
- Information architecture
- Application architecture
- Technology architecture

Implementation methods and developmental focus areas (Figure 15) can be:

- Management
- Processes
- Expertise
- Information management
- Technology solution
- Productional solutions

Strategic Enablement

The effects on development areas are organized according to the strategic objectives defined by the organization (Figure 16). Possible development areas are, for example:

- Profitability
- Growth
- Customer satisfaction
- Process efficiency
- Learning

Name Fields

Name fields have a pop-up with a photo/avatar and email address (Figure 17).

Office Integration

Thinking Portfolio allows the opening MS Office documents from the portfolio, editing them locally, and saving back. The service is based on Webdav technology.

Smart Templates

Smart Templates are Office document templates that can be opened in the portfolio for local editing.

Project's Prioritisation

Project's prioritisation criteria change depending on the organisation. Thinking Portfolio makes it possible to view all the criteria in one picture (Figure 19).

Evaluation view consists of costs, benefits and risks. Every criteria can have factor (how to emphasize the criteria). Decision-makers can utilise these evaluations when prioritising.

User Interface based on project type

Different projects can have different templates suitable for them (e.g. R&D or IT-development). Also widgets can be changed according to the project type.

Figure 19. Project prioritisation

Federated Single-Sign-On

The new single-sign-on solution of Thinking Portfolio is based on Microsoft Active Directory Federation Services (ADFS 2.0). The solution supports both SAML 2.0- and WS Federation 2.0 -based authentication schemes. No custom software is required at the customer side and the solution works from any internet location.

Koskee kaikkia toimintoja.</p> <p><input type="checkbox"/> 4 = Strateginen yhdelle toiminnolle tai projektiin tulokset hyödyttävät koko yritystä.</p> <p><input checked="" type="checkbox"/> 3 = Projektillä vastataan tulevaisuuden kilpailuun, tulevaisuuden kilpailuun tai strategien yksittäisen toiminnon projekti.</p> <p><input type="checkbox"/> 2 = Tukee vuosittaisen painopisteiden saavuttamista tai toimintasuunnitelman toteuttamista.</p> <p><input type="checkbox"/> 1 = Koskee vain yhtä ohjelma-alueita tai toimintoa yksittäisessä kehittämisskohteessa.</p> <p><input type="checkbox"/> 0 = Ei tietoa.</p>
Yhteensopivus toimintatapoihin (10 %)	<p>Tavoiteltavat vaikutukset: Projekti on yhteensopiva toimintatapojen kanssa</p> <p><input checked="" type="checkbox"/> 5 = Parantaa nykyistä toimintatapa.</p> <p><input type="checkbox"/> 4 = Ei vaikutusta toimintatapoihin.</p> <p><input type="checkbox"/> 3 = Edellyttää nykyisten toimintatapojen yhteensovittamista tai kehittämistä.</p> <p><input type="checkbox"/> 2 = Edellyttää uusien toimintatapojen määrittelyä ja käyttöönottoa.</p> <p><input type="checkbox"/> 1 = Toimintaprosesseja muutetaan merkittävästi, jolloin monien toimintatapoihin/tehtäviin tulee muutoksia.</p> <p><input type="checkbox"/> 0 = Ei tietoa.</p>
Kilpailuetu/Välttämättömyys (10 %)	<p>Tavoiteltavat vaikutukset: Projektiin tuotosten/hyötyjen avulla voidaan saavuttaa kilpailuetua</p> <p><input type="checkbox"/> 5 = Kriittinen kilpailuetu ja välttämätön (esim. lainsäädännön muuttumisen vuoksi). Projektiin toteuttamisella saavutetaan merkittävä etu tai vastataan kilpailuun benchmarkkaamalla "tyyvä tuote".</p> <p><input checked="" type="checkbox"/> 4 = Projektillä vastataan kilpailuun strategisesti. Kilpailuetu muodostuu mahdollisesti myöhemmin tulevaisuudessa.</p> <p><input type="checkbox"/> 3 = Saattaa olla tulevaisuuden kilpailuetu.</p> <p><input type="checkbox"/> 2 = Projekti ei ole välttämätön, parantaa olemassaolevaa.</p> <p><input type="checkbox"/> 1 = Organisaatiossa on jo vastaava palvelu, jota uusi palvelu "osaa" tuomatta lisäarvoa. Uusi palvelu ei tuota merkittävää kilpailuetua.</p> <p><input type="checkbox"/> 0 = Ei tietoa.</p>
Resurssit	Painoarvo 20 %
Tarvittavat henkilöresurssit (10 %)	<p><input type="checkbox"/> 5 = alle 1 henkilö, 0-2 kk, 10-50% työajasta.</p> <p><input type="checkbox"/> 4 = useampi henkilö, 0-2 kk, 10-50% työajasta.</p> <p><input checked="" type="checkbox"/> 3 = useampi henkilö 2-12 kk/vuosi.</p> <p><input type="checkbox"/> 2 = 1-3 henkilötyövuotta.</p> <p><input type="checkbox"/> 1 = yli 5 henkilötyövuotta yhteensä.</p> <p><input type="checkbox"/> 0 = Ei tietoa.</p>
Riskit	Painoarvo 30 %
Osaaminen ja kokemus (10 %)	<p>Arvior käytettävissä oleva osaaminen ja kokemus</p> <p><input type="checkbox"/> 5 = Matala riski, osaamista ja kokemusta löytyy omasta talosta. Tuttu toimintatapa jonka haasteet tunnetaan ja osataan ratkaista.</p> <p><input type="checkbox"/> 4 = Pieni riski, jonkin verran kokemusta vastaavasta löytyy.</p> <p><input checked="" type="checkbox"/> 3 = Hallittava riski. Riski on hallittavissa. Esim. talossa ei ole kokemusta kyseisestä toimintatavasta, mutta osaamista on saatavilla/hankittavissa.</p> <p><input type="checkbox"/> 2 = Suuri riski. Täyttä osaamista ei ole valmiina (edes hankittavissa).</p> <p><input type="checkbox"/> 1 = Erittäin suuri riski – uusi asia josta ei osaamista missään.</p> <p><input type="checkbox"/> 0 = Ei tietoa.</p>

Figure 20. Project prioritisation

Thinking Portfolio® Timesheet

– Recording and reporting resource use

Thinking Portfolio Project Portfolio offers an easy-to-use solution for recording working hours on a project..

The user fills in completed hours in a weekly timesheet (Figure 22). The new design is based on user feedback we received on previous versions. The hours can be recorded on projects and respective tasks for one calendar week at a time.

The timesheet shows in a handy tooltip window hours used during the last week, month, and year.

The mobile timesheet Web app lets users record their project working hours with a smartphone (see the illustration on page 1).

The administrative user can modify the task types of the timesheet. The tasks can also be linked to on-going development and maintenance operations. This makes it easier to steer and control an individual's work distribution.

The person hours recorded on Thinking Portfolio can be reported using several reporting templates. If needed, the list can be exported as an Excel spreadsheet for tailored reporting needs.

The timesheet reports are useful if the organization needs to invoice based on hourly fees, internally or on client projects. We can also create a client-specific interface for transferring data into a resource management or invoicing system.

We can set up specific rules for recording hours. For example, the system can allow users to input hours only to the projects where the user role has a specific role. Furthermore, we can permit a project secretary or a project manager to input hours for other users if necessary.

Project	Task	Description	Mon 13/9	Tue 14/9	Wed 15/9	Thu 16/9	Fri 17/9	Sat 18/9	Sun 19/9	Total
Roll out Humak II (Star)	Billable expert work		7.5	4	3	2	1			17.5
Agile test	Test planning			3	2	2	1			8
eCommerce	Definition			1	2	2	2			7

Figure 22. Hour reporting

Multiple Project Resourcing

Resource planning is project based activity. Multiple project resourcing enables to utilise resources from multiple projects in same view.

User selects wanted projects and then opens the resource page. After that, planned hours can be filled in.

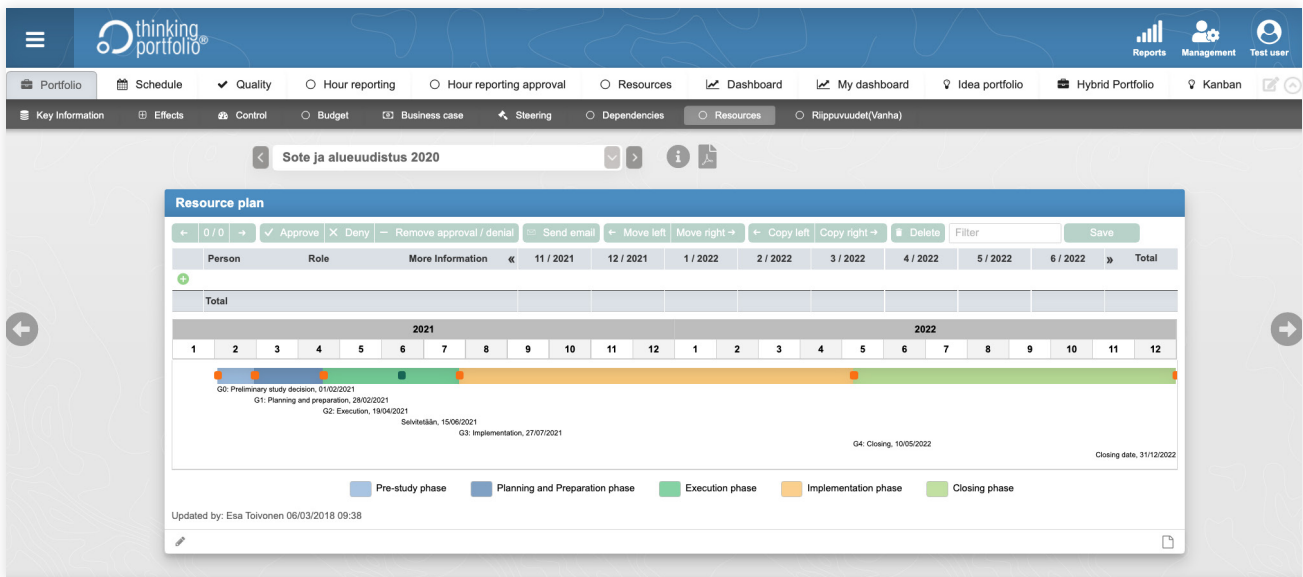

Figure 23. Resource Planner page of a project

Resource Planner

– Resource Allocation Planning

Thinking Portfolio allows the balancing of resource capacity based on demand, and the identification of the most critical roles and resources at any given moment.

Versatile project resource management is a standard feature of Thinking Portfolio. It starts off by defining key resources that are needed for each project task (Figure 24). During the first, idea phase a resource is typically role-based. This enables resource planning at key task level.

During the next project stage (definition or planning) a resource can be a named person. Before moving into the realization phase, a resource can be a fixed for the whole duration of the project, or for one month at a time. After binding a person to the whole project duration the resource plan can be approved e.g. for the coming three months.

Resource planning automatically calculates and takes into account a named resource's assignments on other projects. Each person can even have an individual quota of line operation hours that cannot be used for projects.

Project resource management visualizes the resource statuses of employees with traffic lights. This helps in getting a quick overview of the efficiency of resource management at a certain point in time, or in the future.

There are many standard reports available for resource management (Figure 25). In addition, we can define client-specific reports. It is also possible to export resources data as an Excel file.

In short, Thinking Portfolio allows the balancing of resource capacity based on demand, and the identification of the most critical roles and resources at any given moment.

Figure 25. Resource report

Task Planner

– Monitoring Portfolio Progress

Thinking Portfolio offers a flexible and easily modifiable management of tasks.

Thinking Portfolio supports the creation of diagrams, e.g. GANTT charts. The graphical presentations visualize task dates, durations, and milestones (Figure 26).

Individual tasks can have owners, priorities, and statuses (Figure 27). If required, linkages between tasks can be presented and they can be even defined to other projects. Tasks can be connected to a project phase and which allows live project progress reporting.

Milestones can signify certain financial events, e.g. points of cost control or payments to subcontractors.

Each task can have descriptive, free form text, and hyperlinks to documents contained in a document management system.

Project task planning generates reports that make communicating of project status easy and visual.

Thinking Portfolio® Snapshot

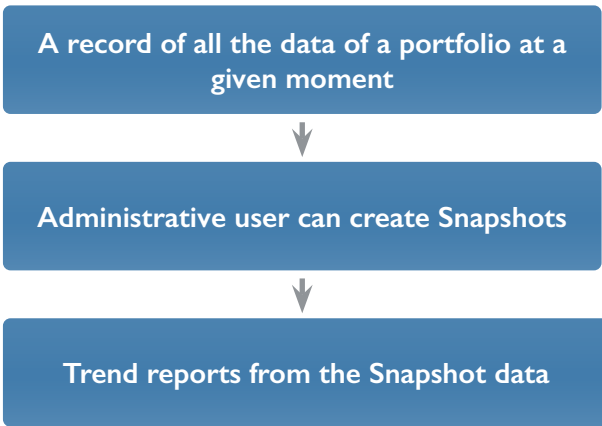

– Monitoring the development of the portfolio

Snapshot

A snapshot is a record of all the data of a portfolio at a given moment. Administrative users can save and manage snapshots on the Management menu (Figure 28).

When a snapshot is activate the user sees the portfolio as it was at the moment of the snapshot. The contents are in read-only mode.

When there are more than one snapshots available you can create trend reports from the data (Figure 29).

	Name	Created by	Creation date	Trend reporting

Figure 29. Portfolio budget based on phases (left) and project counts in different phase (right)

Reporting

– Views to the portfolio

Thinking Portfolio's reports crystallize the situation and future for the executive management (Figures 30-38). The reports' view and presentation method depend on their functional purpose, and are defined customer-specifically.

A so-called Project Charter generated for every project contains, in a single report, all the information entered from the project into the system. Examples of other possible reports used in portfolio management:

- Developmental focus areas
- Project risks
- Anticipated benefits related to goals
- Effects on development areas
- Budget forecast – target vs. actuals
- Development investments
- Time schedule

Reporting examples

New!

Map Report

A new report type (Figure 42), which allows presenting the data on a map.

Names of countries, continents

The point size can be specified

Automatic zooming

Grouping of nearby map points

Monte Carlo simulation

Monte Carlo simulation (Figure 43) and charts typically related to it, for example, frequency graph (or histogram) and cumulative graph.

The example in the figure displays two risks defined by triangular scattering, from which a graph was calculated that reflects the probability of the outcome (histogram). In addition, there is a cumulative graph, where at point 50%, for example, there is a median for the outcome.

The calculation and graphs can also be used in the assessment of project costs or profits, for example.

Changes in resourcing report

Changes in resourcing reported conveniently (Figure 44).

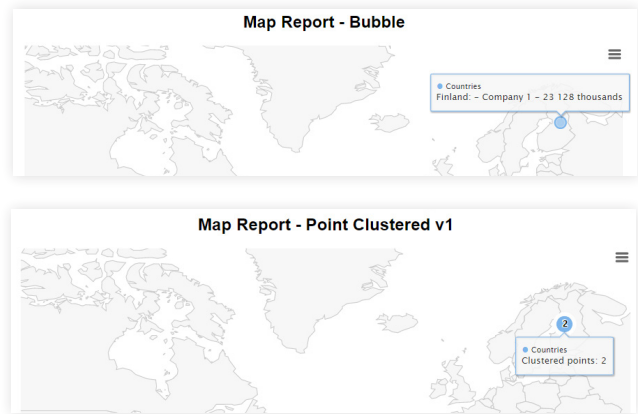

Figure 42. Map report

Gantt reports

New!

Gantt schedule report

Schedule report (Figure 45) is a Gantt chart that shows the main project phases and milestones. The report can be filtered according to start and finish date. A Gantt chart can show the dates of project closing reports automatically and visualise the task flow of the project, connected to project phasing and situational pictures.

Gantt Roadmap report

A report for planning the strategic content of projects in the long term. Improves the usability of the Gantt report, because it shows the data in a lower space (Figure 46).

- The lines go in order in a minimum number of rows, i.e. fit in a low space
- The text goes on two or more rows and is cut if it is too long.
- The text is not shown if the bar is too small

Figure 45. Gantt schedule report

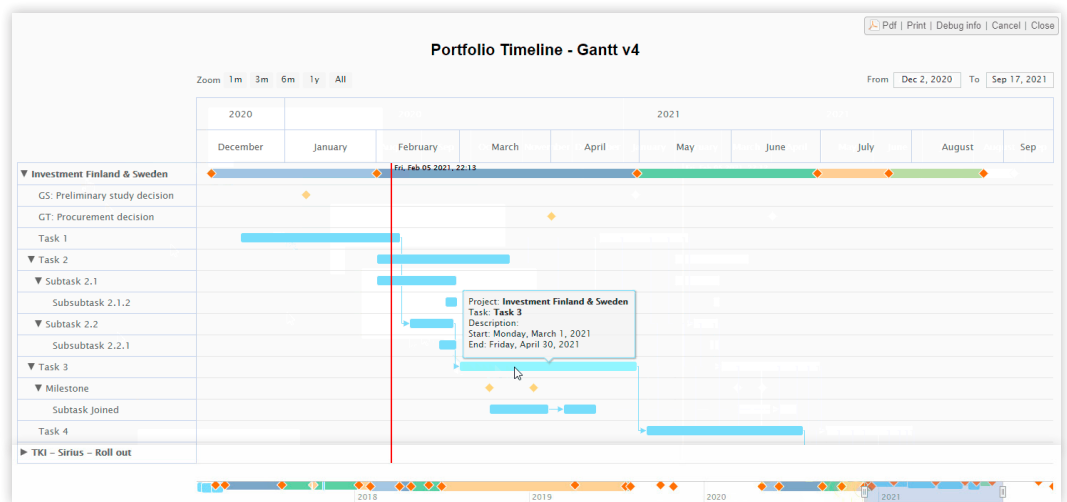

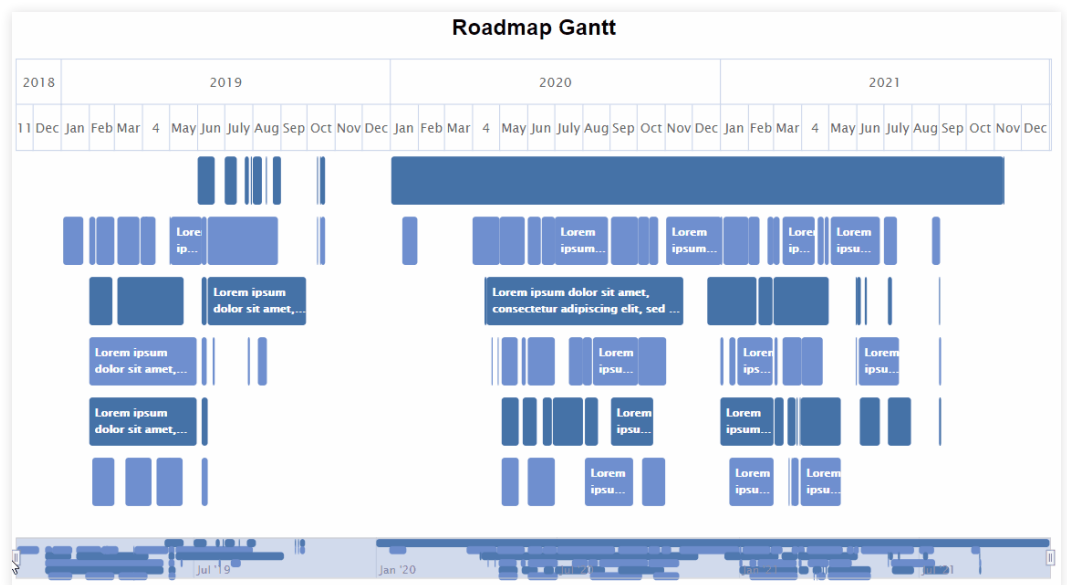

Figure 46. Gantt Roadmap report

Smart Tables

—flexible, versatile, dynamic tables

SmartTables allow more versatile and flexible tables, which can be edited dynamically and thus intuitively. SmartTables enables, among other things, versatile filtering functionalities, use of alternative templates, and hierarchies for filtering rows.

SmartTables (Figure 47) allows, for example, the creation of templates for different types of projects. It can be used, for example, to create to-do lists or checklists for a given project. Ability to hide tabs / panels allows showing project-specific content – for example, so-called simple vs. rich project data.

Compact mode

SmartTable's compact presentation mode (Figure 48), which helps place SmartTable in locations with limited space.

SmartTable also enables the following functionalities:

- More than one header row
- Ductile column width
- Versatile row filtering options
- Table template modification rights to selected users
- Attaching documents and attachments
- Use of simple HTML tags in the table: bold, italics, underline and strikethrough
- Possibility to force the user to fill in cell-specific data. For example, if the user selects a certain phase, the date of the given gate must also be defined.
- Copying of selected columns to another SmartTables table.
- Management of table templates by administrators and / or specified user groups.

Figure 47. SmartTables table view

Highlighting of an active period

SmartTables shows a given active period highlighted (Figure 49).

ValueCopier's SmartTable support

A new SmartTable feature (Figure 50), which allows, for example, a budget or business case to be prepared at the start of a project, and it can be easily copied to a version that is updated during the project, while retaining the original to make the comparison easier.

SmartTables templates

Several alternative templates can be created for a table (Figure 51). By default, selecting a template from a selection list replaces the table data with the content compliant with the selected template. Another way is to use the Add template function, which adds the data contained in the selected template at the bottom of the previously selected template. The modification and creation right of templates can be granted only to administrators, for example, or, alternatively, even to a larger group of specified users.

Hierarchies

A hierarchical list can be ordered by dragging and dropping (Figure 52). A hierarchical list can be, for example, a to-do list with subtasks. Showing / hiding rows can also be achieved based on hierarchy.

Idea Portfolio

– A Managed Process for Ideation

All development projects do not stem from a necessity. Instead, they originate from an idea of doing things differently. The challenge of the management is to collect ideas systematically, evaluate and prioritize them, and finally, turn them into project proposals.

The purpose of Thinking Portfolio Idea Portfolio is to make this process easier and to incorporate idea management as a part of project portfolio management.

The Idea Portfolio View

The idea portfolio view opens up from the menu of the project portfolio window. The view displays all the ideas and their key information in a table (Figure 41).

The idea view functions are similar to those of the project portfolio view. You can filter the list, select ideas individually, and sort them using column headings. You add a new idea using the “Add idea” button. Registered users of the project portfolio are granted access to the idea portfolio.

The idea portfolio view can contain, for example, the following information:

- Idea title (acts as a link to an idea card)
- Category (defined by the client)
- Idea owner
- Idea presenter
- Date of the idea
- Idea pipeline stage (phases are client-specific)
- Status of the idea
- Number of likes
- Number of comments (comments become visible by clicking the count)

Figure 53. Idea portfolio

Idea Card

An idea card presents an idea and allows commenting and liking the idea (Figure 42).

The presenter of the idea writes a short description of the idea and evaluates its value using the criteria that the organization provides.

An idea card can contain, for example, the following information:

- A descriptive title
- Description (can include hyperlinks)
- Category (client-specific)
- Attachments
- Value score
- Risk evaluation
- Related ideas

The users of the idea portfolio can like an idea or comment on it. A user has an option to follow up on the idea as it receives more comments.

The screenshot shows the 'Customer Service Robot - ROBO' idea card in the Thinking Portfolio system. The card is titled 'Customer Service Robot - ROBO' and is sponsored by Esa Toivonen. It includes a description of the idea, a problem statement, and a target. The card is rated 3.5 stars and has 4 comments. The interface also shows a 'Priorisation' section with a 2x2 matrix and a bar chart, and a 'Related Ideas' section with 'Mobiili ystävä MOBI' and 'Häidenkirju kiuas'. The card is part of a portfolio of ideas, and the user can interact with it by liking, commenting, and following up.

Thinking Portfolio® Hybrid Portfolio

– Visual views to support decision making

Many organizations and companies face challenges as projects are managed using different methodologies. How can differently managed projects, programs and continuous development be brought under the same portfolio and managed in a consistent way?

Thinking Portfolio has created new functionalities and views to visualize agility in the project portfolio, to support management decision making and communications.

The basic principles of agile development have been applied to Scrum teams, but these practices have not widely been taken into use in portfolio management, yet. One of the highest priorities of the management, taking agility to the portfolio level, is leading the cultural change and ensuring coherent reporting of all development activities. Regardless of the framework, the top management responsibility is to ensure value creation and prioritization – to ensure that right things are done at the right time and at the right quality.

From strategy to epics

Epics – large entities that are derived from the business strategy – are in the core of Lean Portfolio Management. In the first example view (Figure 43), high-level progress of the epics is followed up (time/function). The progress of the epic is easily detected visually and a single epic can be opened into its own “Epic card” where the properties of each epic – such as features and user stories – can be maintained. Adding new epics or editing the existing epics from the buttons in the top ribbon is easy.

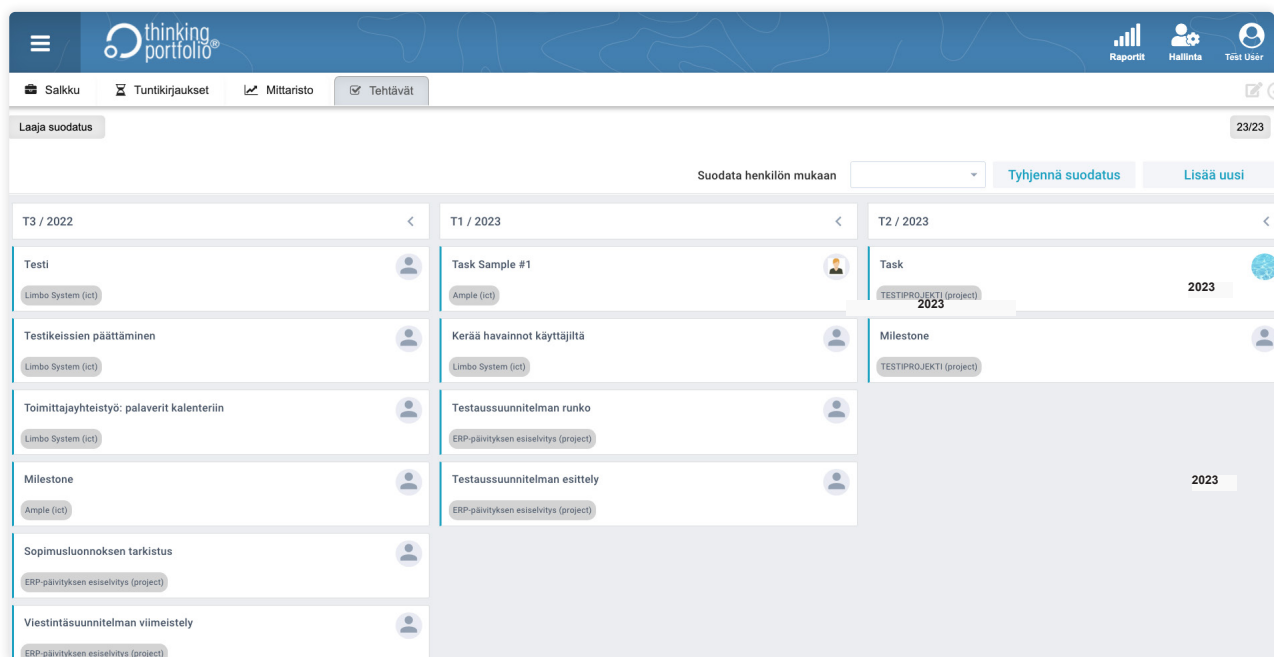

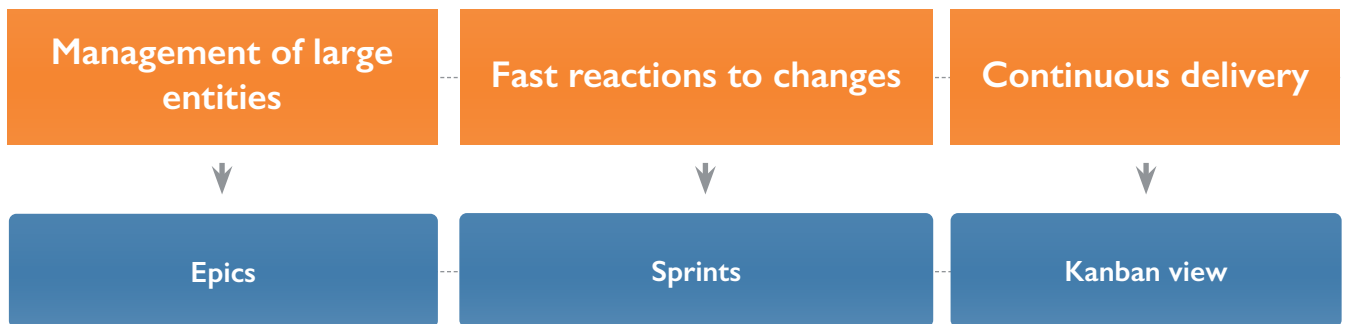

Figure 55. Progress of epics by quarters

Hybrid Portfolio Views

Examples: Sprints and Kanban view

A project using agile methodologies comprises of a team which works in an iterative and incremental way. The end result will be delivered step by step during several development phases (sprints). Each sprint produces a viable and defined version of the product. With this method, the team is able to create value to the customer as quickly as possible. At the same time, the level of predictability and risk management will improve. The way of working during the sprints enables fast reactions to requirement changes as the project moves forward.

In the second example view (Figure 44), the progress of sprints and their contents (User Stories, features) is followed up. Agile methodologies usually recommend User Stories for requirement management. The focus in the User Stories is business value.

Third example view (Figure 45) is a visual and functional Kanban board. The Kanban board can be applied to the management of portfolio level, product portfolio and tasks. The backlog receives all the features for the delivery pipeline. One of the main priorities of the Kanban board is to ensure continuous delivery. This means limiting the number of WIPs to avoid bottlenecks. The items are chosen to the delivery pipeline through value definition and continuous prioritization. Prioritization is a key factor in omitting waste and ensuring that the focus remains on value creation.

Good communication is in the core of agility. To ensure continuous value creation and feature flow, it is essential to maintain open channels of information, encourage continuous learning, facilitate user participation in co-design and a retain a clear view of the project targets and priorities.

Customisation

Customisation

Thinking Portfolio is customized to meet the customer's portfolio needs, as well as portfolio management processes and concepts. The user interface can be in the Finnish, Swedish, English, German, or Dutch languages (Figure 46).

Conceptual independence and parameterization have been the starting points for the design of Thinking Portfolio's database structure. Customers can personally modify the tool facilitating the maintenance of the directory fields visible in different user interfaces.

Different portfolio models

Thinking Portfolio's basic components – the widgets – facilitate the construction of various portfolio models. The widgets' content can be parameterized according to the concepts used by the customer.

The application's database solution has designed for maximum flexibility; customer-specific customization requires no structural modifications in the database.

Thanks to its structural solution, customizing the application customer-specifically for Proof of Concept use is rapid.

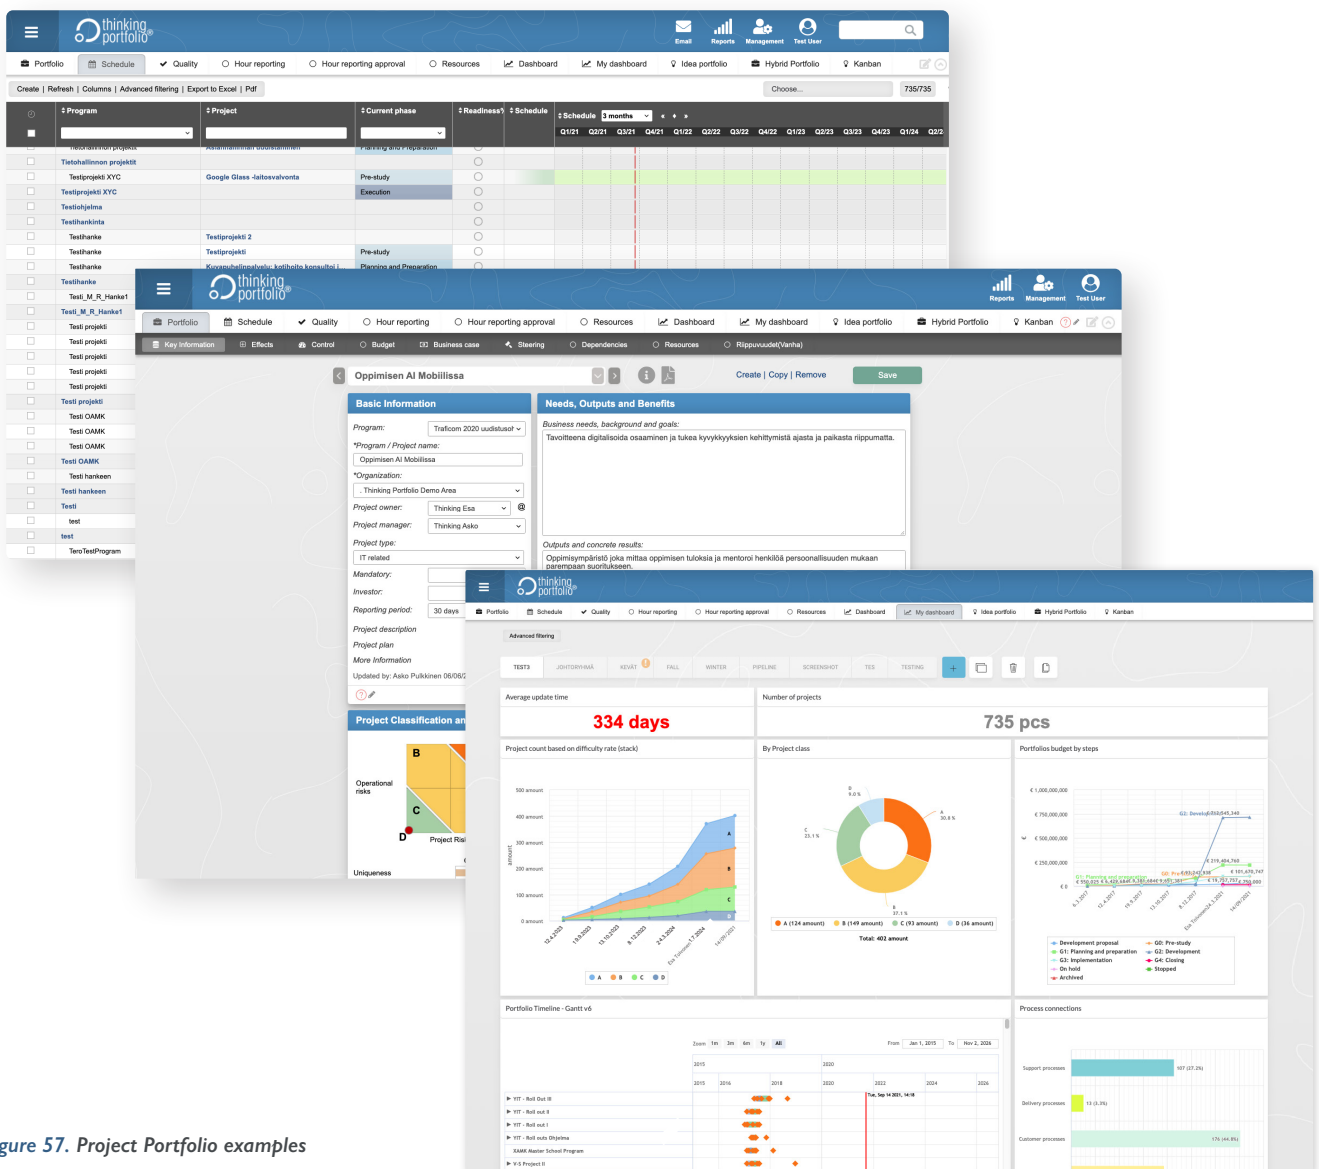

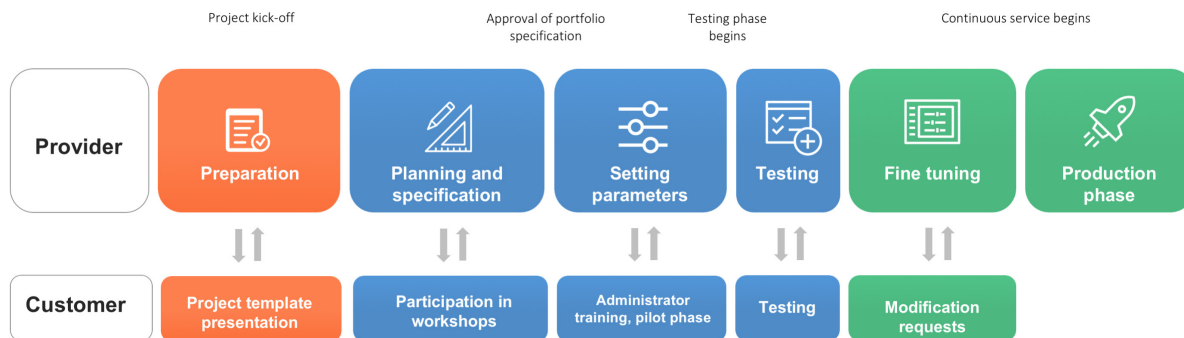

Figure 57. Project Portfolio examples

Implementation and Use

User interface

Thinking Portfolio is a completely browser-based application functioning with the latest versions Edge, Chrome, Firefox, and Safari, as well as with iPad browsers.

User management

The specification of Thinking Portfolio's access control is role-based (Figure 47). With the Project Portfolio, the roles can be, for example, a member of the board of directors, a member of a steering group, project manager, and so forth. The role nomenclature is determined customer-specifically.

The portfolio application has one or several administrators who have extended rights, for example, the right to establish new projects. An administrator can be designated for the entire application, or for example, for the portfolio of a certain business area.

Project-specific work progress models describe each user's role and access to certain stages of a project. After logging into the system, the user can, depending on his or her designated project role, either browse, report, edit, or approve the results of a project stage.

User identification

The application supports two different access control methods: Windows identification, and internal user ID and password identification.

In Windows identification, the system's user name is the same as in the ActiveDirectory. Traditional user identification can be used, for example, when external Internet users are accessing the applications.

Different Portfolio Reference Models

Thinking portfolio has a range of reference models called Portfolio Landscape. Thinking Portfolio's basic components – the widgets – are the building blocks to construct various portfolio models. The widgets' content can be parameterized according to the customer's needs. The Thinking Portfolio platform has been designed for maximum flexibility; customer-specific customization requires no structural modifications in the database.

Support Service

The service model includes telephone and e-mail support for the customer's administrative user. We have a monthly service agreement model for customers that want flexibility in making changes in platform.

Consulting services

Sometimes setting up a portfolio feels like a big hurdle and planning the roll-out like a huge step. We offer custom designed services for your detailed process review and development, portfolio, and roll-out planning, to ensure a smooth launch for your platform supported process.

REST API

WebHooks

Our Service Model

Thinking Portfolio hosting solution is provided in co-operation with TeliaCygate Ltd, a leading European data center provider. All Cloud data storages are located in Finland. The user organization does not need any local installations or applications and the latest updated version of our Thinking Portfolio platform is continuously at all customers' use.

Usage and maintenance are managed over secure connections. Limiting the use to certain IP addresses is also possible.

The service model includes telephone and e-mail support for the customer's administrative user.

Proof of Concept

We recommend the implementation of our fast Proof of Concept project (PoC) with the customer. After a few meetings, we will customer-specifically implement an application that be accessed from our server for a trial period of one month.
